

- If your pet has stopped breathing, read our [CPR](#) advice
- Vomiting or diarrhoea
- Collapse/ fainting

Other signs of a less severe allergic reaction include:

- Skin rash/ bumps
- Mild swelling elsewhere on the body
- Drooling
- Limping if the legs or feet are affected

Step two: For severe reactions

- Go straight to your vets if your pet is having difficulty breathing, or if their face/neck/throat is swelling up quickly.
- If possible, phone your vets on the way to let them know you are coming.

Covid-19 update: During lockdown, it's important to call your vet practice to check they are open before you arrive. If they are closed, it's likely that you will be directed to another local practice.

Step two: For a mild reaction

- If your pet is suffering from a mild allergic reaction (no breathing problems or rapid swelling), call your vet for advice.
- They may need medication such as anti-histamines and other anti-inflammatories to keep them comfortable and stop their reaction getting worse.
